GiveLife: issue vs fixed

10 November 2026, 15:45 PKT

The fixes below are implemented and locally checked in the review branch. **PR #191 is still open and unmerged; deployment is pending.**

Screen / control	Issue found	Fixed behavior in review code
Notes toolbar	Formatting buttons overflow narrow phones.	Buttons wrap inside the available width.
Notes Lock	The editor workspace can remain visible after locking.	The workspace is hidden while Notes is locked.
Preview: three dots	The menu extends outside the phone screen and clips actions.	The menu stays within the viewport; short screens can scroll the menu.
Preview: landscape	Next / Regenerate sit behind the bottom dock.	They sit above the dock and hide while editing.
Donor row menu	Opened options are clipped by the row or short screen.	The menu escapes row clipping and uses a viewport panel on short phones.
Donor search	Search covers donor tabs while they remain underneath it.	Covered tabs hide while phone search is expanded.
Follow-up	DM-only navigation and buttons overlap the Follow-up content.	Follow-up shows its own content and actions, with DM-only controls hidden.
Reply	The action footer covers Add on short screens.	The footer stays in normal flow so Add remains reachable.
Report + Reply	Report reopens after a delay and covers the dialog just opened.	Automatic Report restoration yields to an already-open dialog.
Back / amount labels	The Messages Back label and desktop amount chip are clipped.	Padding and width allow the labels to fit at the tested sizes.
Thank donors button	At 280 / 320px, the button is squeezed to 48px and its text overflows.	The button uses the central phone action slot, with room for its label.
Thank donors modal	The footer covers pace options and Preview / recipients on short phones.	The composer scrolls in its own area; actions remain in a separate footer row.

Still blocked: live side view in this chat. There is no Desktop opener and the preview relay is unavailable.

Verification: 46 states at 13 sizes; 598 checks in the combined full-run and focused-rerun inventory. Chromium, synthetic records and fake transport. This does not establish that every possible width, browser, action outcome or production flow is verified.
